

Brake professionals will be astonished

Once again, ROMESS, for well over 40 years specialist for brake maintenance, will be present at the Automechanika in Frankfurt with a number of innovations (see back page). The focus here is the new device SE 3.

Werner Rogg, ROMESS CEO. It also gives the opportunity to catch infringers who copy many protected features, but do not reach the ROMESS quality. Mr. Rogg: "These companies are not only in China but also in Germany!"

This is a compact, well-designed product that is based on the ROMESS technology, leading and patent-protected in 37 countries. It reaches an operating pressure of 2.8 bar, which is continuously adjustable. The SE 3 ensures an organized workshop : A side-mounted hose holder and a large tool tray on the six-gallon tank do the job very comfortably. Practical: The SE 3 is also suitable for mobile use.

"The Automechanika serves not only as a platform to show our equipment," says

Dear readers, we'll see you in Frankfurt, where the professionals meet at the Automechanika. We will be very pleased to see you there, and of course the fact that we may present you with some interesting innovations in brake maintenance. Our SE 3 in the low price segment standard - just wait - you'll see! In Frankfurt we must look exactly for unjust practice done to our extensive copyists' rights. The list will no doubt be long. For users this is a good reason to opt for the original brand, namely ROMESS. This is worthwhile in any case.

Have fun reading!

Yours Werner Rogg

Werner Rogg is proud of the first generation of new brake maintenance device SE 3.

New and elegantly shaped: the sensor of the Inclinometer CM-09606.

Re-designed

HighTech in a pleasant shape: This is fulfilled by the inclinometer CM-09606 from ROMESS. With the help of this device, the vehicle level can be established on the position of the wishbone or the drive shaft - as well as generally supporting surfaces in degrees. Now, the device looks, thanks to the newly designed sensor even better.

Order quick

The Brake Tool 8911 is currently being offered at a particularly advantageous price. It is suitable for vehicles of all makes and specifically designed to meet the ROMESS demands. It is connected to the onboard diagnostic port (OBD 2) and has 15 functions.

Braketool 8911.

Adapter case made to measure

ROMESS is the manufacturer of brake maintenance devices which enables, due to a variety of adapters, the service of almost every vehicle.

Also on offer are solutions for so-called "exotic" vehicles.

Now auto work-shops who focus on vehicles of certain manufacturers can take advantage of our special service: ROMESS now offers an adapter case for certain brands, which are specially compiled for specific customer requirements.

Also very interesting: There are also special adapters which are not available on the open market.

ROMESS adapter case, compiled for Toyota.

Highest precision

The ROMESS measuring device 09860 accelerates the band production extremely fast and accurately.

The requirement was high: An assembly line had to be accelerated to about 200 vehicles per day. ROMESS contributed with the measuring device 09860.

When applied the device perceives the wheel hub toe and caster and adjusts a high-precision measurement extremely fast.

The workers on the assembly line have an analog monitor display (red-yellow-green) - the digital value is stored in the architectural system of the production system and detains the statistical distribution values for each vehicle. The software and hardware of this measuring unit is fully integrated into the customer's network.

"We accomplish such solutions from a single source," said ROMESS CEO Werner Rogg. "Plant construction is one of our strengths - we work well together with other external companies."

Werner Rogg,
ROMESS-CEO

PremiumLine

The best that the market has to offer. For users who need a "continuous runner" for their workshop.

My current tip for the **PremiumLine**: S 15

The S 15 is an all-rounder in terms of its capacity designed for daily usage, easily refilling justifies economical handling. Tank capacity: 19 litres. This is of course also a device particularly well suited for ABS. Application example: Mercedes S-class.

Norbert Siebold,
ROMESS-Sales Manager

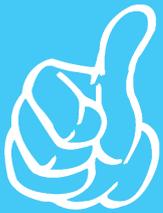

BusinessLine

Proven ROMESS technology at attractive conditions designed to appeal workshop professionals, who want quality, but also pay attention to the price.

My current tip for the **BusinessLine**: S 20 DUO

The ROMESS S 20 DUO is an easy demountable brake maintenance device for canisters of up to 20 litres. This allows comfortable servicing of hydraulic brake systems. The S 20 DUO version is provided with a pre-drainage system, whereas the S 20 is without pre-drainage. Application example: Audi.

Marco Weislogel,
ROMESS-mechanic

EcoLine

Functional technology at a favourable price. Users also benefit from the know-how of the market leader in brake maintenance.

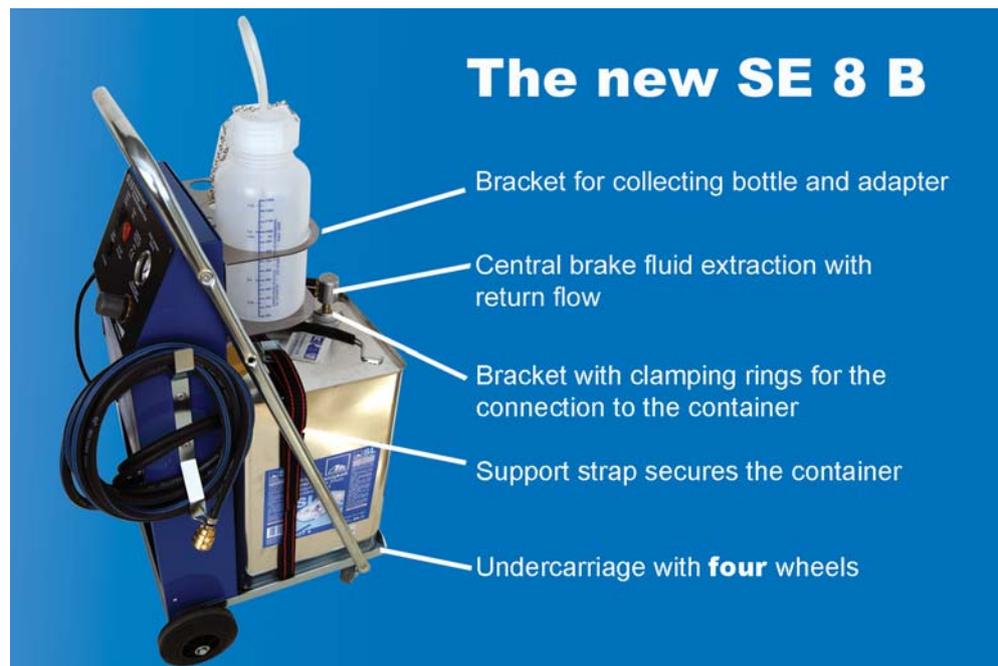

My current tip for the **EcoLine**: SE 8 B

The SE 8 B is the first ROMESS brake maintenance device in modular design. This brings significant cost advantages in shipping, because the device can be extremely compactly packaged. The customer receives three modules and the device can be built together very quickly. SE 8 B can be used with canisters of up to 20 liters. Application example: Renault.

The ROMESS SE 8 B, a competitively priced basic unit for use with containers, is now even better. At the Automechanika it will be presented with a larger tool tray. In addition, the working height has been increased.

However, the fundamental advantage to the user is likely to be that the central pipe system is guided into a metal cone holder. As a result locking claws anchor themselves firmly in the opening of the container, which assures safe and clean working without bubbles.

The cone holder is simply pressed down firmly. So that at the same time the contact with the atmosphere is suppressed (outside air). The mobile base with four wheels as opposed to two, which is common in this price range, makes the handling very comfortable.

Trade meeting at ROMESS

Fair News: The SE 3 is perfectly designed, compact and very powerful. The highlight: integrated bracket on the housing for the collection bottle (below).

The Automechanika is again this year a magnet for trade visitors.

Hall 8, E 50 - ROMESS presents in a new, even bigger stand, the current technical stand. Innovations in brake maintenance, wheel alignment and diagnosis will be shown. In addition to the new device SE 3, ROMESS shows the improved SE 2 and the improved SE 8 B (see page 3) together with other products in the low-price segment.

The technology leader is looking forward to an intense customer interest - and will be pleased to see business partners and interested parties from worldwide. Just in time for the Automechanika ROMESS has an unique anniversary - the top unit of the product range, the S 15, has now reached over the million sales barrier. A visit to the ROMESS booth for

users with diverse requirements will be rewarding. Our offers include a choice of three product lines in which devices are available in a price range from 500 to 1700 Euros.

Werner Rogg: "I am quite certain - everyone finds a device that is ideal for him. Our devices are technically top and also extremely robust."

Customers and suppliers know: ROMESS is worldwide a good partner. Demonstrated not only by the certification according to DIN EN ISO 9001: 2008.

SE 2: Tank or canister? - All the same!

Very practical: The SE 2 may be operated either with canister or tank (below).
